DETAILED ACTION

Election/Restrictions

Restriction to one of the following inventions is required under 35 U.S.C. 121:

- I. Claims 1-42, drawn to a method for preparing trisubstituted olefins, classified in class 585, subclass 500+.
- II. Claims 43-45, drawn to a method of ring-closing metathesis of an enone, classified, for example, in class 568, subclass 417.

Inventions I and II are unrelated. Inventions are unrelated if it can be shown that they are not disclosed as capable of use together and they have different modes of operation, different functions, or different effects (MPEP § 806.04, MPEP § 808.01). In the instant case the different inventions are distinct because the method for the synthesis of trisubstituted olefins can be used to create a larger product molecule from two individual reactant starting materials and has the general effect of creating larger product molecules with no additional ring. The ring closing metathesis reaction, on the other hand has the effect of creating a smaller product molecule from a larger reactant molecule and is subject to constraints not present in the acyclic olefin case such as angle strain and creates at least one new ring. The effects of the two processes are thus diametrically opposed. The Examiner further points out that Applicants' single example (Page 18, TABLE 5, entry 2; entry 1 is not an enone) of enone ring closing metathesis

generates a disubstituted olefin and not a trisubstituted olefin thus placing this reaction outside the scope of claim 1.

Because these inventions are distinct for the reasons given above and the search required for Group I is not required for Group II as demonstrated by their differing classifications, restriction for examination purposes as indicated is proper.
